NATIONAL HPV VACCINATION CAMPAIGN IN SCHOOLS

Human papillomavirus (HPV) infections are very common and highly transmissible, mainly through sexual contact. An estimated 80% of the population comes into contact with these viruses at some point in their lives. Often asymptomatic, HPV infections can cause precancerous lesions and/or cancers of the cervix and other cancers, such as those of the throat, vulva or anus. HPV vaccination prevents up to 90% of these infections. For several years now, it is recommended for girls and boys aged between 11 and 14.

In order to improve vaccination coverage among girls and boys, and as announced by the President of the Republic on 28 February 2023, a national HPV vaccination campaign in schools will be rolled out annually in France from the start of the 2023-2024 school year by the Ministry of Health and Prevention in conjunction with the Ministry of Education and Youth.

All pupils in 5^{ème} class (year 8/7th grade equivalent) are offered the opportunity to be vaccinated against HPV infections.

Full protection is achieved with two vaccine doses. The two doses will be given six months apart during the 5^{ème} class year.

This vaccination is entirely free of charge and will be carried out by mobile teams selected from vaccination centres and consisting of qualified staff equipped to vaccinate adolescents.

The written consent of both parents will be required. On the day of the vaccination session, children whose parents have given permission for them to be vaccinated must bring their health or vaccination booklet with them.

Information sessions may be arranged for parents and pupils in 5^{ème} class. Ministry of Education health staff (school nurses and doctors) can also answer your questions.

For more details about this vaccination, you can:

- Ask your doctor for more information
- Read the information leaflet on HPV vaccination attached to this letter
- Visit the websites:

LEARN MORE ABOUT VACCINATION AGAINST HPV CANCERS

Why should my child be vaccinated?

Today, HPV vaccination prevents up to 90% of HPV infections that cause cancer. It is recommended for girls and boys against:

- precancerous lesions and/or cancers of the cervix, vulva, vagina and anus; benign but painful lesions that appear on the skin or mucous membranes of the anus and genital region (anogenital warts).

SAFE AND EFFECTIVE VACCINATION

For more than 10 years, more than 6 million doses prescribed in France, more than 300 million worldwide.

Rigorous international monitoring.

The widespread use of HPV vaccines, the monitoring carried out in many countries and internationally, and the results of specific studies have confirmed their excellent safety profile, recognised by the WHO.

Thus, for example, no link between these vaccines and autoimmune diseases has been demonstrated.

The effectiveness of HPV vaccination has been observed in countries where the number of young adults vaccinated is high, such as Australia (reduction in cancers and precancerous lesions of the cervix and anogenital warts in men and women).

LEARN MORE ABOUT HUMAN PAPILLOMAVIRUSES

What is HPV?

HPVs are human viruses called papillomaviruses. 80% of women and men are exposed to these viruses in the course of their lives. HPV infections generally disappear within a few months, but a small proportion may persist and develop into disease.

What is the link between HPV viruses and cancer?

There are almost 200 types of HPV, some of which cause precancerous lesions and cancers. HPV can also cause anogenital warts.

How are HPV viruses transmitted?

These viruses are transmitted by simple contact with the genitals, usually during sexual intercourse, with or without penetration.

EVERY YEAR IN FRANCE, 6,400 NEW CASES OF CANCER ARE CAUSED BY HUMAN PAPILLOMAVIRUSES. While the majority of HPV cancers occur in women, more than a quarter occur in men.

Number of HPV-induced diseases in women and men in France in 2015 (according to Shield et al., Hartwig et al., 2015).

	MEN	WOMEN
Cancers of the penis / Cancers of the vulva and vagina	100	200
Cancers of the anus	400	1,100
Cancers of the oropharynx (mouth, throat, etc.)	1,300	400
Cervical cancers	—	2,900
Precancerous lesions of the vulva, vagina and anus	130	around 2,500 to 3000
Precancerous lesions of the cervix (CIN2+)	—	around 30,000
Anogenital warts	around 50,000	around 50,000
